Title: Balancing Code, Revision Deadlines, and Group Dynamics

A. Situation or Experience During the Midterm period, after receiving the extensive revision list for *SkilledWorkers* during our capstone defense, we had to start implementing the actual changes. We focused on revising the user profile settings so clients can select specific skills, restructuring worker accounts to support portfolio uploads and certification verifications, and adjusting our database for standard pricing logic. On top of coding these feature overhauls, I had to keep up with our other academic deliverables, including assignments for Euthenics 2. Because the coding and testing took up long hours late into the night, keeping open communication with my groupmates while handling my own fatigue became a major challenge during this grading period.

B. Emotional and Cognitive Response Throughout this period, I felt mentally drained, anxious about missing deadlines, and hyper-focused on technical details. I caught myself getting impatient whenever minor misunderstandings happened during group updates or when documentation wasn't aligning immediately with the new database schema. My internal thought process was, *"I'm spending all my energy fixing the core logic, so I don't have extra patience for small miscommunications."* However, I realized that letting stress dictate how I communicate with my groupmates only slows us down and creates unnecessary friction.

C. SEL Insight: Self-awareness + Relationship Skills This experience highlighted the importance of self-awareness and relationship skills under pressure. I realized that recognizing my own stress triggers—like mental exhaustion from debugging—is the first step to controlling how I respond to others. Instead of giving short or passive answers when tired, I started practicing clearer, more patient communication with my groupmates about technical requirements and my current progress. I learned that maintaining good group dynamics and mutual respect is just as essential as writing working code when finishing a
